

IWD and IW gearboxes

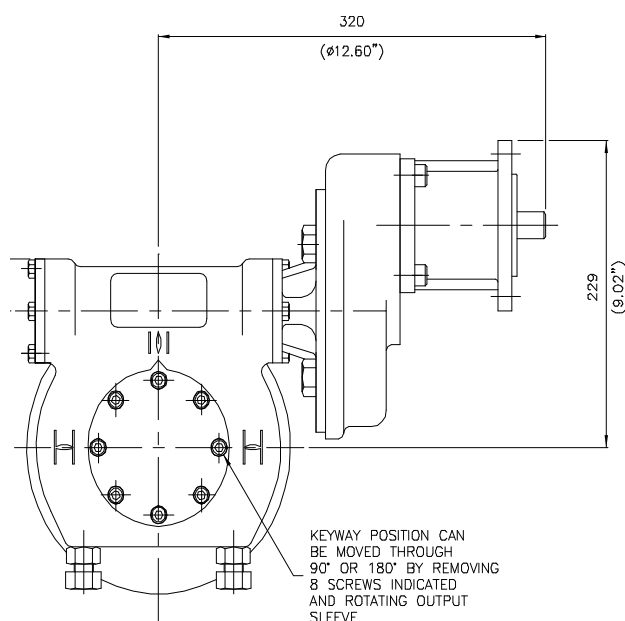

IWD gearboxes meet the same performance as the standard IW range, however they have a unique flange designed to accept the actuator without a base fitted.

Note that the IWD gearboxes can only be used for IQ and AWT range and are limited to size 1,2. Where an IWD gearbox size and ratio meets the required sizing, it can be used.

If larger sizing requirements are specified than those available for the IWD or for all A range, IW range must then be used.

Please see below the difference between the standard IW range and the IWD range.
